CCN: Network Applications Protocols	
Dr. E.SURESH BABU Assistant Professor Computer Science and Engineering Department National Institute of Technology, Warangal. Warangal, TS, India.	
Outline Application Layer Protocols	
 ★ Application Layer Protocols ★ Web Protocols ✓ Overview of HTTP Transformation through Inprovention	
Application Layer Protocols	

Why is Application Layer Protocols are Required	
❖ Usually, Network Processes communicate with each other by sending	
MESSAGES into sockets.	
✓ How these messages are structured?	
√ What are the meanings of the various fields in the messages?	
✓ When do the processes send the messages?	
* Application-layer Protocol will define the answer to all the above	
questions	
Purpose of Application Layer Protocols	
 Specifically, Application-layer Protocol specifies the details, such as: 	
✓ The syntax and semantics of messages that can be exchanged	
✓ Whether the client or server initiates interaction	
✓ Actions to be taken if an error arises	
✓ How the two sides know when to terminate communication	
Application Layer Protocols	
An Application-layer Protocol is only one piece of a network	
application	
Application-layer Protocols specify two aspects of interaction	
1. Representation	
2. Transfer.	
	i

Aspect	Description
Data Representation	Syntax of data items that are exchanged, specific form used during transfer, translation of integers, characters, and files between computers
Data Transfer	Interaction between client and server, message syntax and semantics, valid and invalid exchange error handling, termination of interaction
⋄ Web uses separate	protocols to describe web page syntax and web
page transfer.	
Application F	Protocol Examples
❖ Web Browsing	
❖ Email	
❖ File Transfer	
❖ Remote Login And	i Remote Desktop
❖ Domain Name Sys	stem (Name Lookup)
Applica	tion Layer Protocols : Web Protocols

	Juu	·LIUII	···	44 C D

- In Early 1990s, a major new application World Wide Web had arrived as the first Internet application.
- The World Wide Web is one of the most widely used services in the Internet.
- Web servers as a platform for many killer applications emerging after 2003, including YouTube, Gmail, and Facebook.

Advantages of Web

- Using Web,
 - It is relatively easy for any individual to make information available over the Web
 - ✓ Everyone can become a publisher at extremely low cost.
 - ✓ Hyperlinks and search engines help us navigate through an ocean of Web sites.
 - ✓ Graphics stimulate our senses.
 - Forms, JavaScript, Java applets, and many other devices enable us to interact with pages and sites.

Three Key Standards- World Wide Web Service Uses'

* Web is complex, many protocol standards have been devised to specify

various aspects and details

Standard	Purpose
HyperText Markup Language (HTML)	A representation standard used to specify the contents and layout of a web page
Uniform Resource Locator (URL)	A representation standard that specifies the format and meaning of web page identifiers
HyperText Transfer Protocol (HTTP)	A transfer protocol that specifies how a browser interacts with a web server to transfer data

Hyper Text Markup Language (HTML)	
❖ Representation standard for multimedia documents	
❖ Specifies document is entirely in printable text	
❖ Document contains markup guidelines rather than precise, detailed	
formatting or typesetting instructions	-
Uniform Resource Locator (URL)	
protocol:// computer_name : port / document_name ? parameters	
http://nitw.ac.in/cse/faculty.html	
http://10.45.10.1 : 80/cse/faculty.html	
2.1.p.,, 2.1.1.1.2.2.2., 2.0, 2.0, 2.0.2.3, 2.1.1.2.2	
	l
World Wide Web- Review	
❖ A Web page (also called a document) consists of objects.	
✓ An object can be HTML file, a JPEG image, a Java applet, or a	
video clip	
✓ All the objects are addressable by a single URL .	-
✓ Most Web pages consist of a base HTML file and several	
referenced objects.

Overview of HTTP	
	1
Hyper Text Transfer Protocol (HTTP)	
The Hyper Text Transfer Protocol (HTTP) is a Web's application-layer	
protocol.	
* HTTP is the heart of the Web.	
The HTTP is the primary transfer protocol that a browser uses to	
interact with a web server.	

Hyper Text Transfer Protocol (HTTP)
 HTTP usually implemented in two programs: a client program and a
server program, which are two different end systems that talk to each
other by exchanging HTTP messages.
❖ In the client-server model, a browser is a client that extracts a server
name from a URL and contacts the server.
Hyper Text Transfer Protocol (HTTP)
•
❖ HTTP can be characterized as follows:
√ Specifies format and meaning of messages
✓ Each message represented as text
✓ Transfers arbitrary binary data
✓ Can download or upload data
<u> </u>
How HTTP Works ?
-
❖ HTTP defines
✓ How Web clients request Web pages from Web servers and
✓ How servers transfer Web pages to clients.

HTTP used Client/Server Model	
-	
PC running processing to the state of the st	
Firefox browser (2)	
sever Running Apache Web	
Server iPhone running Safari browser	
HTTP used Client/Server Model	
* Client: Web Browser requests, receives, (using HTTP protocol) and	
"displays" Web objects	

Underlying Protocol

response to requests

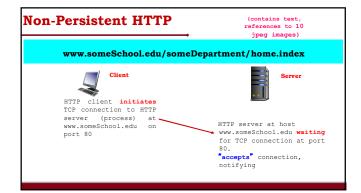

- HTTP uses TCP as its underlying transport protocol
- ❖ The HTTP client first initiates a TCP connection with the server.

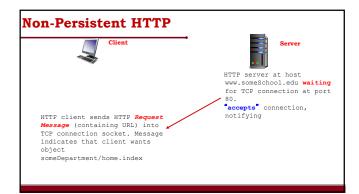

Server: Web server sends (using HTTP protocol) objects in

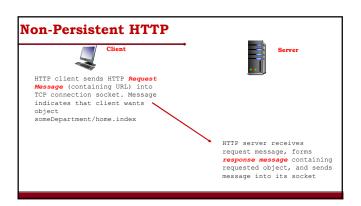

- Once the connection is established,
 - ✓ The browser and the server processes access TCP through their socket interfaces.

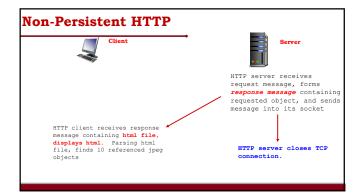

© Client initiates TCP connection (creates socket) to server, port 80 © Server accepts TCP connection from client ITTP messages (application-layer protocol messages) exchanged between browser (HTTP client) and Web server (HTTP server) TCP connection closed HTTP uses TCP as a underlying protocol TCP connection closed TCP provides a reliable data transfer service to HTTP. HTTP need not worry about lost data or reordering of data within the network. It is job of TCP and the other protocols in the lower layers of the protocol stack. Dbservation HTTP is "Stateless" Protocol Server maintains no information about past client requests If the HTTP protocols that maintain past history (state) It is required, when server/client crashes, their views of "stats" may be inconsistent, must be reconciled	HTTP uses TCP as a underlying protocol	
HTTP uses TCP as a underlying protocol TCP connection closed HTTP uses TCP as a underlying protocol TCP provides a reliable data transfer service to HTTP. TCP provides a reliable data transfer service to HTTP. HTTP need not worry about lost data or reordering of data within the network. It is job of TCP and the other protocols in the lower layers of the protocol stack. Observation HTTP is "Stateless" Protocol Server maintains no information about past client requests If the HTTP protocols that maintain past history (state) It is complex! It is required, when server/client crashes, their views of "state"	HTTP uses TCP as a underlying protocol	
✓ HTTP need not worry about lost data or reordering of data within the network. ♦ It is job of TCP and the other protocols in the lower layers of the protocol stack. Observation ♦ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests ♦ If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state"		
within the network. It is job of TCP and the other protocols in the lower layers of the protocol stack.		
The protocol stack. Observation HTTP is "Stateless" Protocol Y Server maintains no information about past client requests If the HTTP protocols that maintain past history (state) It is required, when server/client crashes, their views of "state"		
Observation HTTP is "Stateless" Protocol Server maintains no information about past client requests If the HTTP protocols that maintain past history (state) It is complex! It is required, when server/client crashes, their views of "state"		
Observation HTTP is "Stateless" Protocol Server maintains no information about past client requests If the HTTP protocols that maintain past history (state) It is complex! It is required, when server/client crashes, their views of "state"		
 ♦ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests ♦ If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state" 		
 ♦ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests ♦ If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state" 		
 ✦ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests ❖ If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state" 		
 ✦ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests ❖ If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state" 		
 ✦ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests ❖ If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state" 		
 ♦ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests ♦ If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state" 		
→ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests → If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state"		
→ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests → If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state"		
 ✦ HTTP is "Stateless" Protocol ✓ Server maintains no information about past client requests ❖ If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state" 		
✓ Server maintains no information about past client requests If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state"	Observation	
 If the HTTP protocols that maintain past history (state) ✓ It is complex! ✓ It is required, when server/client crashes, their views of "state" 	* HTTP is "Stateless" Protocol	
✓ It is complex! ✓ It is required, when server/client crashes, their views of "state"	✓ Server maintains no information about past client requests	
✓ It is complex! ✓ It is required, when server/client crashes, their views of "state"	❖ If the HTTP protocols that maintain past history (state)	-
may be inconsistent, must be reconciled		
• • • • • • • • • • • • • • • • • • • •	may be inconsistent, must be reconciled	

Non-Persistent and Persistent Connections	
* When this client-server interaction is taking place over TCP,	
1. Each request/response pair be sent over a separate TCP	
connection (Non-persistent Connections).	
2. All the request/response pair should be sent over the same TCP	
connection. (Persistent Connections)	
,	
	-
Observation	
* HTTP uses both non-persistent connections and persistent	
connections.	
✓ By default, HTTP uses persistent connections	
✓ HTTP clients and servers must be configured to use non-persistent	
connections	
Non-Persistent Connections	
❖ At most one object sent over TCP connection	
✓ connection then closed	
❖ Downloading multiple objects required multiple connections	

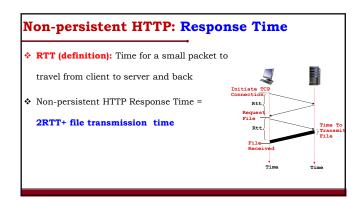

Non-Persistent HTTP : Limitations	7	
❖ Requires 2 RTTs per object		
❖ OS overhead for each TCP connection	-	
* Browsers often open parallel TCP connections to fetch referenced	ed —	
objects	-	
	-	
	_	
	_	
	_	
Persistent HTTP		
* Multiple Objects can be sent over single TCP connection between	en	
client, server.	-	
✓ Server leaves connection open after sending response	-	
✓ Subsequent HTTP messages between same client/server sent over	er	
open connection	-	
✓ Client sends requests as soon as it encounters a referenced object	_	
	_	
Persistent HTTP	7	
•	-	
* Requires only one RTT for all the referenced objects	_	
	_	
	_	
	_	
	_	

HTTP	Message	Format
------	---------	---------------

- ❖ Two types of HTTP messages: Request, Response
- HTTP request message: ASCII (human-readable format)

The Four Major HTTP Request Types

Once it establishes a connection, a browser sends an HTTP request to

the server

Request	Description
GET	Requests a document; server responds by sending status information followed by a copy of the document
HEAD	Requests status information; server responds by sending status information, but does not send a copy of the document
POST	Sends data to a server; the server appends the data to a specified item (e.g., a message is appended to a list)
PUT	Sends data to a server; the server uses the data to completely replace the specified item (i.e., overwrites the previous data)

HTTP Message Format

request line
